

CLAIM

1 I claim:

1. A multiparameter method of screening for the diagnosis, the prevention or the treatment of atherosclerosis-related coronary heart disease
5 (CHD) or stroke comprising;

defining the disease as atherosclerosis-related CHD or stroke;

defining the normal as free from said disease;

defining the following parameters as

10 atherosclerotic parameters consisting of c = the Low-density lipoprotein (LDL) concentration parameter in mg/dL or c = the C-reactive protein (CRP) concentration parameter in mg/L, p = the blood systolic pressure parameter in mmHg or p =
15 the blood diastolic pressure parameter in mmHg, f = the heart rate parameter in s^{-1} , a = the radius parameter of arterial vessels in cm, T = the temperature parameter of blood plasma in $^{\circ}\text{C}$, α = the angle parameter of arterial vessels in degree
20 and z = the axial position parameter of diffusional flux in cm, called diffusional length;

an individual having the measured values of said

atherosclerotic parameters of the following expressions:

25
$$J = A c^{\frac{11}{9}} (v^3 D^{16})^{\frac{1}{27}} \left(\frac{g \cos \alpha + f u}{z} \right)^{\frac{2}{9}} \quad (1.1)$$

or

$$J = B c^{\frac{11}{9}} p^{\frac{1}{3}} T^{\frac{16}{27}} a^{\frac{2}{3}} f^{\frac{2}{9}} z^{-\frac{2}{9}} \quad (1.2)$$

and

$$J = E c^{\frac{11}{9}} D^{\frac{16}{27}} z^{-\frac{2}{9}} (\cos \alpha)^{\frac{2}{9}} \quad (1.3)$$

30 wherein J = the mass transfer flux in $10^{-5} \text{ g}/(\text{cm}^2 \text{s})$,
 A, B and E = the variables that are independent of
 said atherosclerotic parameters, v and u = the
 variables related to said p and said a, D = the
 diffusion coefficient in cm^2/s , and g = the
 35 gravitational acceleration;

determining the normal values of said atherosclerotic
 parameters;

40 determining the disease risks yielded by the
 differences between said measured values and said
 normal values of said atherosclerotic
 parameters;

adding all said disease risks together yields a total
 risk of said disease;

determining a disease risk level containing said

45 total risk of said disease;

selecting an atherosclerotic risk factor related to
an atherosclerotic parameter that is the greatest
contribution to said total risk of said disease so
as to result in said risk factor as a primary
50 therapy target of said disease;

selecting a greater flux between the LDL mass
transfer flux and the monocyte mass transfer flux
so as to result in said greater flux as a primary
cause in said disease;

55 selecting a greater concentration level between the
LDL level in serum and the CRP level in blood
plasma so as to result in said greater level as a
secondary therapy target of said disease;

60 determining a relative ratio between currently said
total risk and previously said total risk so as to
yield said relative ratio as a therapeutic
efficacy of said disease;

65 repeating above-mentioned said methods until said
disease risk level is reduced to a normal level
for said individual who requires the therapy to
prevent or to treat atherosclerosis-related CHD or
stroke; and

above-mentioned said methods are written as an
executable computer program named the MMA.exe
70 © 2004, by X.F. Wang to perform said methods.

2. A method as in claim 1 wherein determining said
disease risk yielded by the difference between the
measured value and the normal value of said LDL
concentration parameter, said method comprising the
75 steps of:

a measured value, c_m in mg/dL, of the individual's
LDL concentration in human serum is determined
using a medical technique for measuring the
concentration of blood constituents or said c_m is
80 determined by the physician;

a normal value, c_n in mg/dL, of said LDL
concentration is determined by the physician or
said $c_n = 100$ mg/dL for adult;

substituting said c_m and said c_n into the following
85 expression where $c_m \geq c_n$:

$$R_1 = \left(\frac{c_m}{c_n} \right)^{\frac{11}{9}} - 1 \quad (1)$$

and

calculating (1) yields said disease risk R_1 caused by
said LDL concentration parameter related to the

90 atherosclerotic risk factors being an elevated LDL concentration in human serum, high-fat diet, hypercholesterolemia or other risk factors that increase said LDL concentration.

3. A method as in claim 1 wherein determining
95 said disease risk yielded by the difference between the measured value and the normal value of said CRP concentration parameters, said method comprising the steps of:

100 a measured value, c_m in mg/L, of the individual's CRP concentration in human blood plasma is determined using a medical technique for measuring the concentration of blood constituents or said c_m is determined by the physician;

105 a normal value, c_n in mg/L, of said CRP concentration and an equivalent factor, F , are determined by the physician wherein $F = \left(\frac{D_c}{D_L}\right)^{\frac{16}{27}}$, D_c = the CRP diffusion coefficient and D_L = the LDL diffusion coefficient or said $c_n = 1.0$ mg/L for adult and said $F = 0.66$;

110 substituting said c_m , said c_n and said F into the following expression where $c_m \geq c_n$:

$$R_2 = F \left(\left(\frac{c_m}{c_n} \right)^{\frac{11}{9}} - 1 \right) \quad (3)$$

and

calculating (3) yields said disease risk R_2 caused by
115 said CRP concentration parameter related to the
atherosclerotic risk factors being an elevated CRP
level in human blood plasma, systemic
inflammation, infectious agents or other risk
factors that increase said CRP level.

120 4. A method as in claim 1 determining said disease
risk yielded by the difference between the measured
value and the normal value of said blood systolic
pressure parameter, said method comprising the steps
of:

125 a measured value, p_m in mmHg, of the individual's
blood systolic pressure is determined using a
medical technique for measuring the human blood
pressure or said p_m is determined by the physician;

130 a normal value, p_n in mmHg, of said systolic pressure
is determined by the physician or said $p_n = 120$
mmHg for adult;

substituting said p_m and said p_n into the following
expression where $p_m \geq p_n$:

$$R_4 = \left(\frac{R_m}{R_n} \right)^{\frac{1}{3}} - 1 \quad (4)$$

135 and

calculating (4) yields said disease risk R_4 caused by
said systolic pressure parameter related to the
atherosclerotic risk factors being an elevated
level of blood systolic pressure, family history
140 of hypertension or other risk factors that
increase said systolic pressure.

5. A method as in claim 1 wherein determining said
disease risk yielded by the difference between the
measured value and the normal value of said blood
145 diastolic pressure parameter, said method comprising
the steps of:

a measured value, p_m in mmHg, of the individual's
blood diastolic pressure is determined using a
medical technique for measuring the human
150 blood pressure or said p_m is determined by the
physician;

a normal value, p_n in mmHg, of said blood diastolic
pressure is determined by the physician or said
 $p_n = 70$ mmHg for adult;

155 substituting said p_m and said p_n into the following expression where $p_m \geq p_n$:

$$R_5 = \left(\frac{R_m}{R_n} \right)^{\frac{1}{3}} - 1 \quad (5)$$

and

160 calculating (5) yields said disease risk R_5 caused by said diastolic pressure parameter related to the atherosclerotic risk factors being an elevate level of blood diastolic pressure, family history of hypertension or other risk factors that increase said diastolic pressure.

165 6. A method as in claim 1 wherein determining said disease risk yielded by the difference between the measured value and the normal value of said heart rate parameter, said method comprising the steps of:

170 a measured value, f_m in s^{-1} , of the individual's heart rate is determined using a medical technique for measuring the human heart rate or said f_m is determined by the physician;

175 a normal value, f_n in s^{-1} , of said heart rate is determined by the physician or said $f_n = 72 s^{-1}$ for adult;

substituting said f_m and said f_n into the following

expression where $f_m > f_n$:

$$R_6 = \left(\frac{f_m}{f_n} \right)^{\frac{2}{9}} - 1 \quad (6)$$

and

180 calculating (6) yields said disease risk R_6 caused by
said heart rate parameter related to the
atherosclerotic risk factors being an elevated
level of heart rate, smoking cigarette, depression
or other risk factors that increase said heart
185 rate.

7. A method as in claim 1 wherein determining said
disease risk yielded by the difference between the
measured value and the normal value of said arterial
radius parameter, said method comprising the steps of:

190 a measured radius value, a_m in cm, of the
individual's arterial vessel at the lesion-prone
sites of arterial bifurcations, arterial
branching, arterial curvatures or arterial
tapering is determined using a medical technique
for measuring the sizes of arterial vessels or
195 said a_m is determined by the physician;

a normal value, a_n in cm, of said arterial radius is
determined by the physician or said $a_n = a$ value
between 0.2 cm and 2.2 cm for adult;

200 substituting said a_m and said a_n into the following expression where $a_m \geq a_n$:

$$R_7 = \left(\frac{a_m}{a_n} \right)^{\frac{2}{3}} - 1 \quad (7)$$

and

205 calculating (7) yields said disease risk R_7 caused by said arterial radius parameter related to the atherosclerotic risk factors being an increased size of arterial radius at said lesion-prone sites or other risk factors that increase the size of said arterial radius.

210 8. A method as in claim 1 wherein determining said disease risk yielded by the difference between the measured value and the normal value of said plasma temperature parameter, said method comprising the steps of:

215 a measured temperature value, T_m in $^{\circ}\text{C}$, of the individual's plasma fluid in the region at said lesion-prone sites is determined using a medical technique for measuring the temperature of human blood plasma or said T_m is determined by the
220 physician;

a normal value, T_n in $^{\circ}\text{C}$, of said plasma temperature is determined by the physician or said $T_n = 37^{\circ}\text{C}$;

substituting said T_m and said T_n into the following expression where $T_m \geq T_n$:

225
$$R_8 = \left(\frac{T_m}{T_n} \right)^{\frac{16}{27}} - 1 \quad (8)$$

and

calculating (8) yields said disease risk R_8 caused by said plasma temperature parameter related to the atherosclerotic risk factors being an elevated temperature of said human blood plasma at said lesion-prone sites, elevated body temperature-related diseases or other risk factors that increase said plasma temperature.

9. A method as in claim 1 wherein determining said disease risk yielded by the difference between the measured value and the normal value of said angle parameter, said method comprising the step of:

a measured value, α_m in degree, of the angle between gravity and the average velocity of the blood fluid in the region at said lesion-prone sites is determined using a medical technique for measuring the human arterial geometries or said α_m is determined by the physician;

245 a normal value, α_n in degree, of said angle is determined by the physician or said $\alpha_n =$ a value between the 10° and 60° for adult;

substituting said α_m and said α_n into the following expression where $\alpha_n \geq \alpha_m$:

$$R_9 = \left(\frac{\cos \alpha_m}{\cos \alpha_n} \right)^{\frac{2}{9}} - 1 \quad (9)$$

250 and

calculating (9) yields said disease risk R_9 caused by said angle parameter related to the atherosclerotic risk factors being a reduced size of said angle or other risk factors that reduce 255 said angle size.

10. A method as in claim 1 wherein determining said disease risk yielded by the difference between the measured value and the normal value of said axial position parameter of the diffusional flux, said method 260 comprising the steps of:

a measured value, z_m in cm, of the individual's axial position of diffusional flux along the inner arterial wall at said lesion-prone sites is determined using a medical technique for measuring

265 the human arterial geometries or said z_m is
determined by the physician;

a normal value, z_n in cm, of said axial position is
determined by the physician or said $z_n =$ a value
between 0.10 cm and 1.00 cm;

270 substituting said z_m and said z_n into the following
expression where $z_m \leq z_n$:

$$R_{10} = \left(\frac{z_n}{z_m} \right)^{\frac{2}{9}} - 1 \quad (10)$$

and

275 calculating (10) yields said disease risk R_{10}
caused by said axial position parameter related
to the atherosclerotic risk factors being a
decrease in said axial position of the diffusional
flux or other risk factors that decrease said
axial position.

280 11. A method as in claim 1 wherein adding said R_1 in
claim 2 through said R_{10} in claim 10 together yields a
total risk of said disease consisting;

285 a current total risk of said disease related to the
currently measured values of said atherosclerotic
parameters; and

a previous total risk of said disease related to the previously measured values of said atherosclerotic parameters.

12. A method as in claim 1 wherein determining said
290 disease risk level containing said total risk of said
disease in claim 11, said method comprising the steps
of:

dividing the disease risk level into the following
295 seven risk sublevels: $0.84 \geq$ first disease risk
level ≥ 0.00 , $1.75 \geq$ second disease risk level $>$
 0.84 , $2.70 \geq$ third disease risk level > 1.75 , $3.70 \geq$
fourth disease risk level > 2.70 , $4.70 \geq$ fifth
disease risk level > 3.70 , $5.80 \geq$ sixth disease
risk level > 4.70 and seventh disease risk level $>$
300 5.80 ; and

selecting a disease risk level containing said
total risk of said disease in claim 11 from among
seven of said disease risk sublevels.

13. A method as in claim 1 wherein selecting an
305 atherosclerotic risk factor related to the
atherosclerotic parameter that is the greatest
contribution to said total risk of said disease in
claim 11 so as to result in said risk factor as a

primary therapy target of said disease.

310 14. A method as in claim 1 wherein selecting said greater flux between said LDL mass transfer flux and said monocyte mass transfer flux so as to result in said greater flux as a primary cause in said disease, said method comprising the steps of:

315 selecting said LDL mass transfer flux as a primary cause in said disease when said R_1 in claim 2 \geq said R_2 in claim 3; or

selecting said monocyte mass transfer flux as a primary cause in said disease when said R_1 in claim 2 $<$ said R_2 in claim 3.

320 15. A method as in claim 1 wherein selecting said greater concentration level between said LDL level in human serum and said CRP level in human blood plasma so as to result in said greater level as a secondary therapy target, said method comprising the steps of:

selecting said LDL level in serum as secondary therapy target of said disease when said R_1 in claim 2 \geq said R_2 in claim 3; or

selecting said CRP level in blood plasma

330 as a secondary therapy target of said disease when
said R₁ in claim 2 < said R₂ in claim 3.

16. A method as in claim 1 wherein determining said
relative ratio between said current total risk of
said disease and said previous total risk of said
335 disease in claim 11 so as to yield said relative ratio
as a therapeutic efficacy of said disease.

17. A method as in claim 1 wherein repeating said
method in claim 2 through said method in claim 16
until said disease risk level is reduced to a normal
340 level for said individual who requires the therapy to
prevent or to treat atherosclerosis-related CHD or
stroke.

18. A method as in claim 1 wherein said method in
claim 2 through said method in claim 16 are written as
345 an executable computer program named said MMA.exe to
perform said methods which comprises:

inputting the currently measured values, the
previously measured values and the normal values
of the individual's atherosclerosis parameters
350 into the input screen of said MMA.exe;

pressing the "update" button and the "calc. risk"
button of said input screen; and

pressing the "evaluate" button so as to yield an
output screen containing a total risk of said
355 disease, a primary cause in said disease, a
primary therapy target of said disease, a
secondary therapy target of said disease and a
therapeutic efficiency for said individual who
requires the diagnosis, the prevention or the
360 treatment of atherosclerosis-related CHD or
stroke.
